

JAVA WORKSHOP CSI W99

Department of Mathematics and Computer Science
Bronx Community College

July 6, 2017

JAVA WORKSHOP DAY 2

1 STRING CLASS

- Special Features
- Relation to char Primitive Type

2 DECISION STRUCTURES

- Simple Decisions
- Two-Way Decisions
- Multi-Way Decisions

3 ITERATION STRUCTURES

- while Loop Statements
- do-while Loop Statements
- for Loop Statements
- break and continue

JAVA WORKSHOP DAY 2

- 1 **STRING CLASS**
 - Special Features
 - Relation to char Primitive Type
- 2 **DECISION STRUCTURES**
 - Simple Decisions
 - Two-Way Decisions
 - Multi-Way Decisions
- 3 **ITERATION STRUCTURES**
 - while Loop Statements
 - do-while Loop Statements
 - for Loop Statements
 - break and continue

SPECIAL FEATURES

SPECIAL FEATURES

- The `String` Class is the most common way to represent normal text in a Java program. Other classes, such as `Scanner`, rely on the `String` Class exclusively for text processing.
- The `String` Class is in the `java.lang` package, which is always automatically imported into any Java program.
- It is the only class which overloads the Addition Symbol (+), to represent concatenation. (The Java language does not support operator overloading—this is the only exception.)

A STRING OBJECT IS COMPOSED OF CHARS

A METHOD THAT RETURNS THE CHARS IN A STRING

CharAt(int n) method returns the character at position n of a String:

If String s = "abcde"; then s.CharAt(3) returns char 'd'.

JAVA WORKSHOP DAY 2

- 1 STRING CLASS
 - Special Features
 - Relation to char Primitive Type
- 2 DECISION STRUCTURES
 - Simple Decisions
 - Two-Way Decisions
 - Multi-Way Decisions
- 3 ITERATION STRUCTURES
 - while Loop Statements
 - do-while Loop Statements
 - for Loop Statements
 - break and continue

SIMPLE DECISIONS—IF STATEMENTS

ACTION ONLY NEEDED IF CONDITION IS TRUE

```
import java.util.Scanner;
public class LetterGrade
{
    public static void main(String[] args)
    {
        Scanner input = new Scanner(System.in);
        System.out.print("Enter Your Average:  ");
        int average = input.nextInt();
        if (average >= 60.0)
            System.out.println("You Passed!");
    }
}
```

TWO-WAY DECISIONS—IF-ELSE STATEMENTS

ACTION WHETHER CONDITION IS TRUE OR FALSE

```
public static void main(String[] args)
{
    Scanner input = new Scanner(System.in);
    System.out.print("Enter Your Average: ");
    int average = input.nextInt();
    String letterGrade = "";
    if (average >= 60.0)
        letterGrade = "P";
    else
        letterGrade = "F";
    System.out.printf("Your Grade is %s",
letterGrade);
}
```

TWO-WAY DECISIONS—CONDITION?A:B OPERATOR

VALUE DEPENDS ON CONDITION (IF TRUE A, IF FALSE B)

```
public static void main(String[] args)
{
    Scanner input = new Scanner(System.in);
    System.out.print("Enter Your Average: ");
    int average = input.nextInt();
    System.out.printf("Your Grade is %s",
        average >= 60?"P":"F");
}
```

MULTI-WAY DECISIONS—NESTED IF-ELSE

MANY CONDITIONS, EACH HAS AN ACTION

```
if (average >= 90.0)
    letterGrade = "A";
else if (average >= 80.0)
    letterGrade = "B";
else if (average >= 70.0)
    letterGrade = "C";
else if (average >= 60.0)
    letterGrade = "D";
else
    letterGrade = "F";
System.out.printf("Your Grade is %s",
letterGrade);
```

MULTI-WAY DECISIONS—SWITCH STATEMENTS

EACH CONDITION IS A VALUE OF A VARIABLE

```
boolean passed;  
switch(letterGrade)  
{  
    case('A'):  
    case('B'):  
    case('C'):  
    case('D'):  
        passed = true;  
    case('F'):  
        passed = false;  
}
```

JAVA WORKSHOP DAY 2

- 1 **STRING CLASS**
 - Special Features
 - Relation to char Primitive Type
- 2 **DECISION STRUCTURES**
 - Simple Decisions
 - Two-Way Decisions
 - Multi-Way Decisions
- 3 **ITERATION STRUCTURES**
 - while Loop Statements
 - do-while Loop Statements
 - for Loop Statements
 - break and continue

INFINITE LOOPS

NOT INTENDED TO TERMINATE

```
while (true)
{
    // code for event handling, say
    // like serving web page requests
}
```

INDEFINITE LOOPS

ITERATIONS TERMINATE BUT NUMBER IS NOT FIXED

```
// Add an arbitrary number of input positive ints
int n = 0, total = 0;
while (n != -1) //Sentinel value -1 is not a valid
input
{
    total += n;
    n = input.nextInt(); // enter -1 to exit loop
}
System.out.printf("Sum is %d", total);
```

DEFINITE (COUNTER-CONTROLLED) WHILE LOOPS

COUNTER MANAGED IN DIFFERENT PARTS OF CODE

```
int total = 0;
int n = 1; // initialize before loop
// find the sum of the integers from 1 to 10
while (n <= 10) // test loop condition
{
    total += n;
    n++; // increment at end of each iteration
}
System.out.printf("Sum is %d", total);
```

DO-WHILE LOOP TESTS CONDITION AFTER EACH ITERATION, NOT BEFORE

AT LEAST ONE ITERATION—THE FIRST—MUST HAPPEN

```
// Add an arbitrary number of input positive ints
int n = 0, total = 0;
do
{
    total += n;
    n = input.nextInt(); // enter -1 to exit loop
}
while (n != -1) //Sentinel value -1 is not a valid
input
System.out.printf("Sum is %d", total);
```

COUNTER IS MANAGED IN FOR STATEMENT

INITIALIZE, TEST LOOP CONDITION, INCREMENT

```
int total = 0;
// find the sum of the integers from 1 to 10
for (n = 1; n <= 10; n++)
    total += n;
System.out.printf("Sum is %d", total);
```

BREAK STATEMENTS IN A LOOP

EXITS LOOP

```
int total = 0;
// find the sum of the integers from 1 to 10
for (n = 1; n <= 10; n++)
{
    if (n == 5)
        break;
    total += n;
}
System.out.printf("Sum is %d", total);
```

BREAK STATEMENTS IN A SWITCH

KEEPS FROM FALLING THROUGH TO NEXT CASE

```
boolean passed;  
switch(letterGrade)  
{  
    case('F'):  
        passed = false;  
        break;  
    case('A'):  
    case('B'):  
    case('C'):  
    case('D'):  
        passed = true;  
}
```

CONTINUE STATEMENTS

EXITS CURRENT ITERATION, BUT LOOP CONTINUES

```
int total = 0;
// find the sum of the integers from 1 to 10
for (n = 1; n <= 10; n++)
{
    if (n == 5)
        continue;
    total += n;
}
System.out.printf("Sum is %d", total);
```
