- (9) What are real numbers? Give 5 examples.
- (10) Give 5 examples of imaginary numbers.
- (11) Is the number $0.777\cdots$ rational? Explain.

Solution. Yes, the number $0.777\cdots$ is rational. Let $x = 0.777\cdots$. Then $10x = \underline{\hspace{2cm}}$.

Hence, $10x - x = \underline{\hspace{2cm}} - 0.777\cdots$.

So, $9x = \underline{\hspace{2cm}}$.

Thus, $x = \underline{\hspace{2cm}}$, which is a quotient of two integers. Therefore x is a rational number.

22. SOLVING LINEAR EQUATIONS

Here we work with equations. An **equation** is a mathematical statement involving equality ($=$). A solution of an equation is a number that when substituted for the variable gives a true statement.

For example, $x = 3$ **solves** the equations $2x = 6$ and $x - 5 = -2$.

(1) Is -4 a solution of $2x = 6$?

(2) Is -3 a solution of $x = 3$?

(3) Is 1 a solution of $5x = 0$?

(4) Is -5 a solution of $-3x = -15$?

(5) Write 5 equations which are solved by -4 .

(6) Write 5 equations which are solved by -5 .

(7) Write 5 equations which are solved by 2 .

Think of an $=$ sign as a **balance**. Whatever you do to one side, you must do to the other side as well. So,

- The **same** number may be **added** to both sides.
- The **same** number may be **subtracted** from both sides.
- Both sides may be **multiplied** by the **same** number.
- Both sides may be **divided** by the **same** non-zero number.

Solve the equations.

$$(1) x + 3 = 11$$

$$(2) 12 = x - 4$$

$$(3) -18 + x = 20$$

$$(4) 2x = 10$$

$$(5) -20 = \frac{x}{5}$$

$$(6) -30 = -6x$$

$$(7) \frac{x}{2} = 10$$

$$(8) -x + 4 = 7$$

$$(9) 2x + 3 = 11$$

$$(10) 12 = 3x - 4$$

$$(11) -18 + 4x = 20$$

$$(12) 2x - 12 = 10$$

$$(13) -x + \frac{1}{3} = 4$$

$$(14) -20 = \frac{x}{5} + \frac{4}{3}$$

$$(15) -30 = -6x + 7$$

$$(16) \frac{x}{2} - \frac{1}{3} = 12$$

$$(17) \frac{x-1}{12} = 2$$

$$(18) -\frac{3x}{2} - \frac{1}{3} = 8$$

$$(19) -\frac{5x}{2} - \frac{11}{3} = \frac{3}{5}$$
