# Second Exam for MTH 23 

November 7, 2017
Nikos Apostolakis

Name: $\qquad$

## Instructions:

This exam contains 7 pages (including this cover page) and 5 questions. Each question is worth 20 points, and so the perfect score in this exam is 100 points. Check to see if any pages are missing. Enter your name on the top of this page, and put your initials on the top of every page, in case the pages become separated.

You may use only the provided formulae sheet. You may not use your book or notes.
You are allowed to use a calculator.
You are required to show your work on each problem on this exam. The following rules apply:

- You have to enter the answer of each question in the provided box or blank line. You have to circle your answer in the multiple choice questions.
- Mysterious or unsupported answers will not receive full credit. A correct answer, unsupported by calculations, explanation, or other work will receive no credit; an incorrect answer supported by substantially correct calculations and explanations might still receive partial credit.
- If you need more space, use the back of the last page; clearly indicate when you have done this.

1. The National Infomercial Marketing Association conducted a survey among buyers of a particular product, and the results are shown in the table below, where $x$ represent the number of times buyers of a product had watched a TV infomercial before purchasing the product, and $p(x)$ the probability that buyers purchase the product after watching it $x$ times. Values of 5 or more for $x$ were treated as 5 .

| $x$ | $p(x)$ |
| :--- | :--- |
| 1 | 0.27 |
| 2 |  |
| 3 | 0.08 |
| 4 | 0.09 |
| 5 | 0.15 |

(a) Complete the missing probability.
(b) What is the probability that buyers watch three or fewer infomercials before purchasing the product?

Answer: The probability is $\square$
(c) Compute the expected value of this distribution.

Answer: The expected value is $\mu=$ $\square$
(d) Compute the standard deviation of this distribution.

Answer: The standard deviation is $\sigma=$ $\square$
2. About $45 \%$ of those called for jury duty will find an excuse to avoid it. Suppose 5 people are randomly called for jury duty, and let $r$ stand for the number of people that actually show up, i.e. they do not find an excuse to avoid it.
(a) Using the appropriate table, fill in the following chart:

| $r$ | 0 | 1 | 2 | 3 | 4 | 5 |
| ---: | :--- | :--- | :--- | :--- | :--- | :--- |
| $P(r)$ |  |  |  |  |  |  |

(b) Find the expected value $\mu$ and the standard deviation $\sigma$ of this probability distribution.

Answer: The expected value is $\mu=$ $\square$
The standard deviation is $\sigma=$ $\square$
(c) Determine the probability that all 5 serve on jury duty.
$\square$
3. The Research Department of a company that manufactures watches has determined that their watches have an average lifetime of 28 months before certain electronic components deteriorate, causing the watches to become unreliable. They have also find that the standard deviation of lifetimes is 5 months and that the distribution of lifetimes is normal.
(a) If the company guarantees a full refund on any defective watch for 2 years after purchase, what percentage of the total production should the company expect to replace?

Answer: The probability is $\square$
(b) If the company doesn't want to make refunds on more than $12 \%$ of the watches it makes, how long should the guarantee period be (to the nearest month)?

Answer: The guarantee should be $\square$ months.
4. Let $x$ be a random variable that represents the level of glucose in the blood (milligrams per deciliter of blood) after a12 hour fast. The random variable $x$ has a distribution that is approximately normal with $\mu=85$ and $\sigma=20$.
(a) What is the probability that $x$ is more than 60 ?

Answer: The probability is $\square$
(b) Suppose that a doctor uses the average $\bar{x}$ for a sample of $n=4$ tests, taken a week apart.
i. What type of distribution does $\bar{x}$ have?

Answer: $\bar{x}$ follows a $\qquad$ distribution, with $\mu=$ $\qquad$ and $\sigma=$ $\qquad$
ii. What is the probability that $75<\bar{x}<100$ ?

Answer: The probability is $\square$
5. Long experience with a certain course shows that about $71 \%$ of the students pass. This fall 80 students are taking this course. Let $r$ be a random variable that represents the number of students that will pass.
(a) What is the number of students expected to pass this semester?

Answer: The number of students expected to pass this semester is $\square$
(b) Explain why the normal approximation to the binomial would apply.
(c) Estimate the probability of at least 60 students passing.
$\square$

## Useful Formulae

## Discrete random variables:

$\mu=\sum x p(x) \quad \sigma=\sqrt{\sum(x-\mu)^{2} p(x)} \quad=\sqrt{\sum x^{2} p(x)-\mu^{2}}$

## Binomial Distribution

$q=1-p \quad P(r)=\binom{n}{r} p^{r} q^{n-r} \quad \mu=n p \quad \sigma=\sqrt{n p q}$
$n!=1 \cdot 2 \cdot 3 \cdots n \quad\binom{n}{r}=\frac{\overbrace{n(n-1) \cdots(n-r+1)}^{r \text { factors }}}{r!}$

## Normal Distribution:

$z=\frac{x-\mu}{\sigma} \quad x=z \sigma+\mu$
$P(a<z<b)=P(z<b)-P(z<a)$
$P(z>a)=1-P(z<a)=P(z<-a)$

## Sampling distribution:

$\mu_{\bar{x}}=\mu_{x} \quad \sigma_{\bar{x}}=\frac{\sigma_{x}}{\sqrt{n}}$
$\bar{x}$ is normal if $x$ is. It is approximately normal if $n \geq 30$.

## Normal Approximation to the Binomial:

Valid when $n p>5$ and $n q>5$.
$P(k \leq r \leq l) \approx P(k-0.5 \leq x \leq l+0.5)$
