

# MTH 30 LECTURE NOTES (Ojakian)

## Topic 20: Expanding the trigonometric functions

---

### OUTLINE

(References: 5.4, 5.2, 5.3)

1. Angles in standard position
  2. Evaluating trig functions for any angle
- 

#### 1. First define on triangle

- (a) The 6 trig functions on angles between 0 and 90 degrees.
- (b) sin, cos, tan and reciprocals: csc, sec, cot

#### 2. Solving Triangles

- (a) Solving a right triangle when you know TWO sides:
  - i. Just the Pythagorean theorem!
- (b) Solving a right triangle when you know ONE side and ONE angle:
  - i. Apply a trig function of the angle which includes the *unknown* side and a *known* side.
  - ii. Solve for the unknown side.
- (c) Like 5.4: 10 to 16

**PROBLEM 1.** Solve each right  $\triangle ABC$  using the given information. In each case  $m\angle C = 90^\circ$ .

- i.  $m\angle A = 80^\circ, b = 72$ .
- ii.  $m\angle A = 30^\circ, c = 33$ .

#### 3. Applications

- (a) Devise a strategy for finding the distance across a lake?
- (b) Devise a strategy for finding the distance across a river? (what is the *relevant* difference between a lake and a river)
- (c) Like 5.4: 46 to 51, 52 to 56

**PROBLEM 2.** The angle of elevation of the top of a fir tree is  $68^\circ$  from an observation point 70 ft. from the base of the tree. Find the height of the tree.

**PROBLEM 3.** The angle of depression from the top of the Empire State Building to a hot dog stand is  $60^\circ$ . How far away is the hot dog stand? (what non-mathematical missing piece of information do we need?)

4. Why expand trig functions?

Consider graphing sine between 0 and 90. What happens if we continue?

- (a) Sound waves
- (b) Light waves
- (c) Length of a day over a year
- (d) Etc!

5. Representing angles with any measure

(a) Standard position:

- i. One side (the **initial side**) points in the positive x-direction.
- ii. The other side (the **terminal side**) rotates from the initial side.
- iii. Positive angle: counter-clockwise rotation.
- iv. Negative angle: clockwise rotation.

(b)

**PROBLEM 4.** Draw the following angles in standard position:

$$45^\circ, -45^\circ, 270^\circ, -90^\circ, 135^\circ, 120^\circ, 450^\circ, \pi$$

(c)

**Definition 1.** Angles with the same terminal side are called **co-terminal**.

**PROBLEM 5.** Which of the above angles are co-terminal. Find yet another angle co-terminal with them.

6. Evaluating trig function from a point on terminal side

$$\sin(\theta) = y/r$$

$$\cos(\theta) = x/r$$

$$\tan(\theta) = y/x$$

csc, sec, and cot are defined as the reciprocals.

**PROBLEM 6.** Evaluate the following:

(a)  $\tan(\theta)$  and  $\sin(\theta)$  where  $(-3, -4)$  is a point on the terminal side of  $\theta$ .

(b)  $\cot(\theta)$  and  $\sec(\theta)$  where  $(-1, 4)$  is a point on the terminal side of  $\theta$ .

**PROBLEM 7.** Evaluate the following:

(a)  $\sin(90^\circ)$

(b)  $\cos(-180^\circ)$

(c)  $\tan(-\pi/2)$

7. When the terminal point is harder to find

- (a) Use pythagorean theorem to find.
- For multiple of 45 degrees:  $x = y$
  - For multiple of 30 or 60: One of  $x$  or  $y$  is  $1/2$ . Find other.

(b)

**PROBLEM 8.** Evaluate the following (use a special triangle if needed):

- $\tan(225^\circ)$  and  $\sin(225^\circ)$
- $\cos(-210^\circ)$  and  $\sec(-210^\circ)$

8. Evaluating trig function using a reference angle

An alternative approach to evaluating trig functions of angles whose terminal side is not on the  $x$  or  $y$  axis.

- Draw the angle in standard position.
- Find the Reference Angle (the angle between the terminal side and the  $x$ -axis).
- Evaluate the trig function at the Reference Angle.
- Leave the answer as is, or modify by making negative, based on:  
The quadrant of the terminal side and the trig function being evaluated.

(e)

**PROBLEM 9.** Evaluate the following:

- $\cos(135^\circ)$ ,  $\sin(135^\circ)$ , and  $\tan(135^\circ)$
- $\sin(7\pi/6)$  and  $\csc(7\pi/6)$

9. Evaluating trig expressions

**PROBLEM 10.** Evaluate the following.

- $\tan \frac{\pi}{4} + \cot \frac{7\pi}{4}$
- $\sec^2 \frac{5\pi}{6}$
