

CSI31
Introduction to
Computer
Programming I

Dr. Sharon Persinger
Fall 2018

Overview

▣ Basic definitions:

- ▣ Computer

- ▣ Computer science

- ▣ Algorithm

- ▣ Programming language

What is a computer?

- ▶ A modern computer is “a machine that stores and manipulates information under the control of a changeable program.
- ▶ Store and manipulate information
- ▶ Changeable program
- ▶ Universal problem solver

What is a program?

- ▶ A computer program is a detailed step-by-step set of instructions to a computer.
- ▶ A program solves a specific problem.

What is Computer Science?

- ▶ "Computer science is no more about computers than astronomy is about telescopes." – Edsger W. Dijkstra
- ▶ Computer science is the scientific study of solving problems by computers.
- ▶ What problems can we solve by computers?
What can be computed?

Related terms and fields

- ▶ Mathematics
- ▶ Computer programming
- ▶ Software engineering
- ▶ Many, many subfields

How do you investigate solving a problem?

- ▣ Describe the problem clearly and completely.
Do you know what a solution is?
- ▣ Find a procedure that solves the problem.
- ▣ Show that there is a procedure that solves the problem.
- ▣ Show that there is no procedure that solves the problem.

Algorithms, computability, complexity

- ▶ An algorithm is a step-by-step process for solving a problem.
- ▶ Design an algorithm.
 - ▶ Understand the problem.
 - ▶ Can this problem be solved at all by an algorithm?
- ▶ Analyze an algorithm.
 - ▶ Is this solution a good one?
 - ▶ Is there a better one?
 - ▶ What does better mean? Time? Space?

Abstract View of Basic Computer Hardware

What happens when you run a program?

- ▶ Program instructions are copied into main memory.

- ▶ CPU executes the program step by step:

fetch-execute cycle.

- ▶ Get the first instruction

- ▶ Decode what it means

- ▶ Carry it out.

- ▶ Then get the next instruction, and so on.

Hardware Details

- ▶ CPU or central processing unit – carries out the basic operations, arithmetic and logical, follow fetch-execute cycle
- ▶ Main memory, RAM, random access memory – stores program and data while program is working on data, volatile
- ▶ Secondary memory – permanent storage of programs and data, hard disk, flash memory, CD

Hardware Details

▣ Input devices – get information from user into computer,

▣ Examples: keyboard, mouse, microphone

▣ Output devices – present information from computer to user

▣ Examples: monitor, printer, speakers

Programming Languages

- ▶ Designed for expressing computer operations – arithmetic and logic – without ambiguity
- ▶ Constructs have syntax – formal rules
- ▶ Constructs have semantics - meaning

Low Level Language – ASM assembly language

```
main proc
```

```
    mov     ax, seg message
```

```
    mov     ds, ax
```

```
    mov     ah, 09
```

```
    lea dx, message
```

```
    int 21h
```

```
    mov     ax, 4c00h
```

```
    int 21h
```

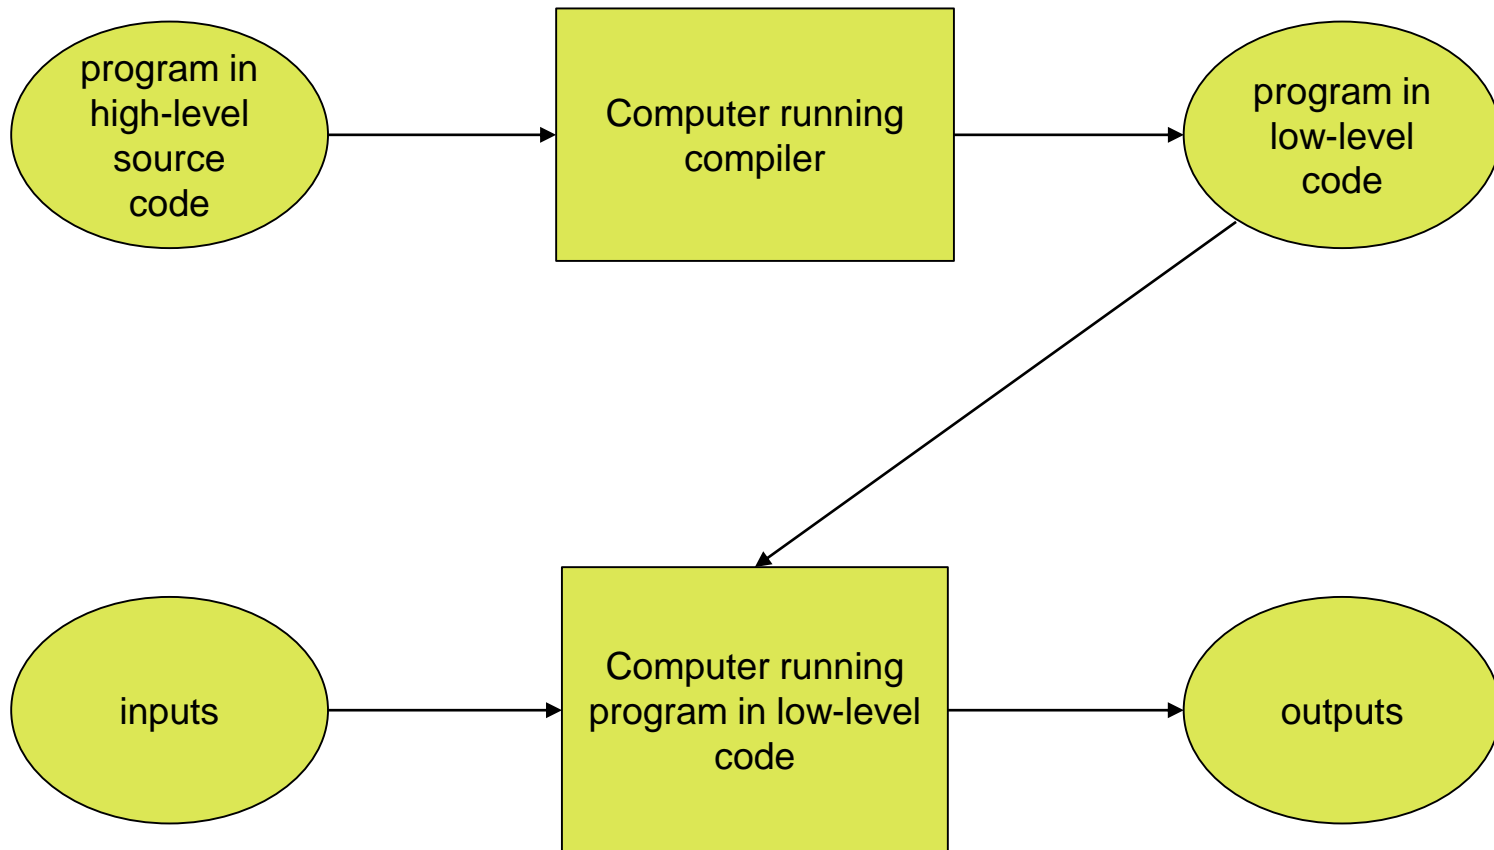

```
main endp
```

```
end main
```

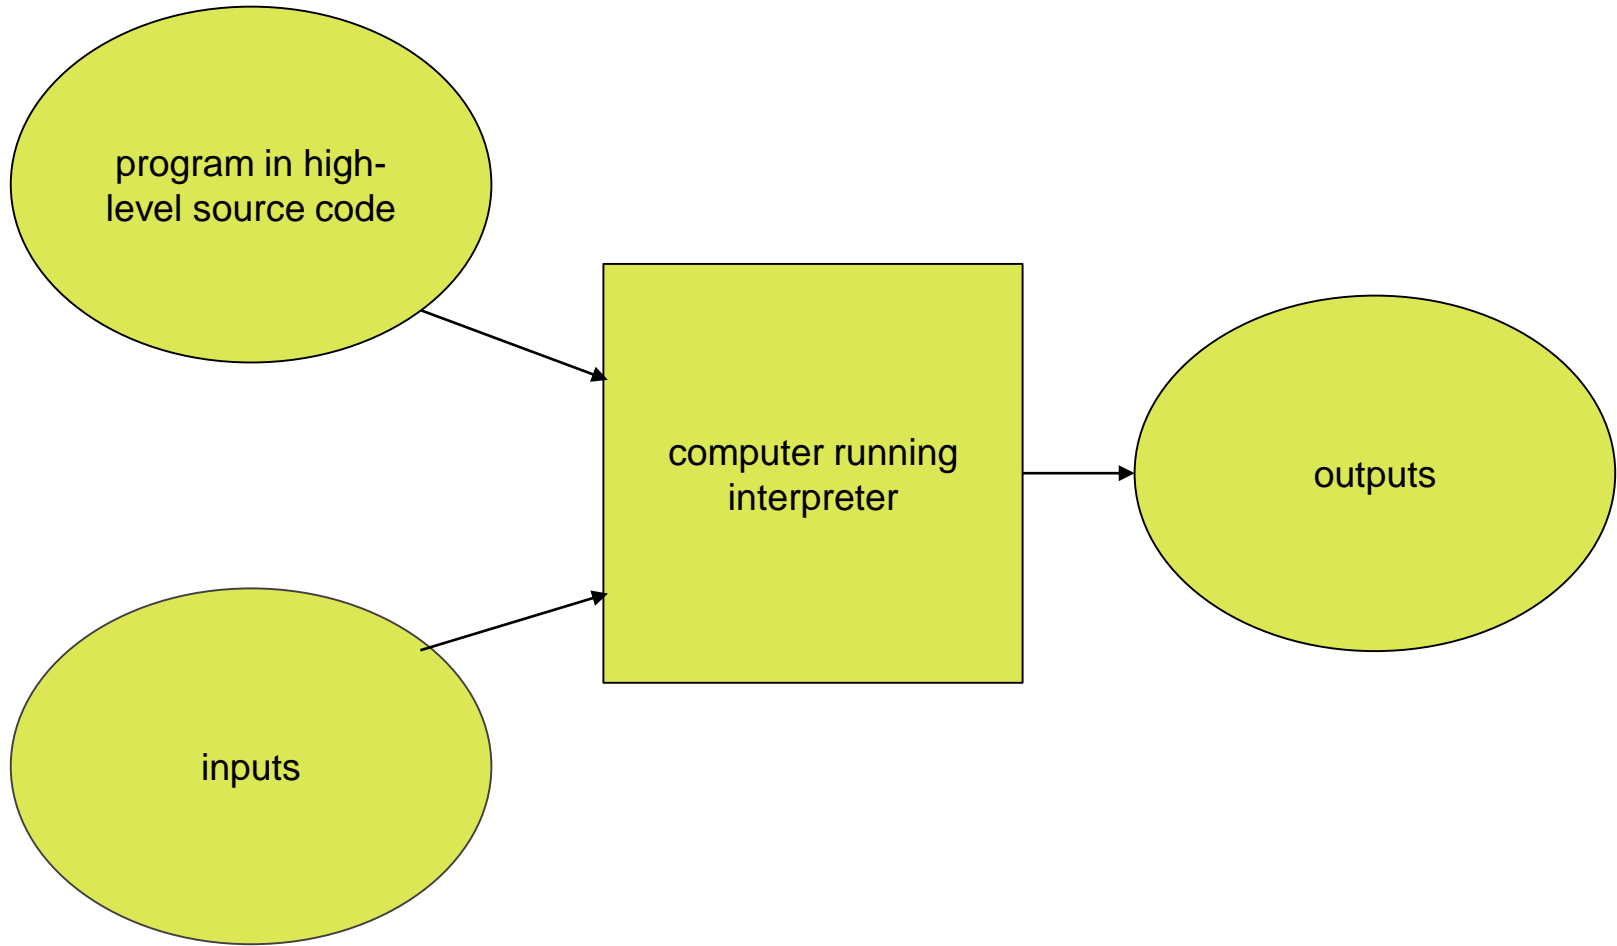

High level vs low level languages

- ▶ Low level languages refer to specific memory locations
 - ▶ moving numbers from memory location into CPU, computing arithmetic, and moving results back to memory
 - ▶ specific to a particular computer architecture
 - ▶ for machines to execute
- ▶ High level languages use notation like mathematics: $a = b+c$
 - ▶ designed for people to write programs
 - ▶ portable to lots of different CPUs

Compiling a program: from high level to low level

Interpreting a program: from high level to low level

Compile vs Interpret

- ▶ **Compiler translates entire program completely.**
 - ▶ compiled program can be run over and over without being recompiled
 - ▶ compiler not needed to execute code
 - ▶ produces faster running programs

- ▶ **Interpreter analyzes and executes the code instruction by instruction**
 - ▶ interpreter needed at run time
 - ▶ flexible programming

▣ Python is an interpreted language.

What will you do in this course?

- ▶ Learn some of the terminology of computer science: CPU, input device, high-level language, compiler, function, top-down design, ...
- ▶ Learn to analyze problems and write Python programs that solve those problems.

Before you leave class

- ▶ Send an email message with the subject CSI31 to prof.persinger@gmail.com
- ▶ Include your name in the body of the message.
